Abstract—The teaching of visual arts during the COVID-19 pandemic is the subject of this writing, which seeks to point out situations and strategies used by teachers who worked in this area of knowledge in the school context, during the years 2020 and 2021. Interviews were held with four professors who worked in different institutions and teaching networks, so that it was possible to understand similarities and differences between them. The aforementioned period was marked in school education by the use of TDIC and remote classes. Several and distinct experiences were recorded by the professors, who, in general, had to dedicate themselves to so many different demands that the specific practices of the visual Arts ended up becoming less evident.

Keywords—Art Teaching, Visual Arts, Educational Technologies, COVID-19.

I. INTRODUCTION

The use of Digital Information and Communication Technologies (DICT) in the educational context is nothing new. Since the turn of the 21st century, with the advent of distance education actions using the internet, we have seen research and practices mediated by digital technologies grow in the context of formal education. However, the use of digital technologies seemed to be timid in the context of basic education, at least until 2019. In 2020, institutions found themselves immersed in immeasurable challenges, with the emergence of the new Coronavirus. Perhaps, for the first time in history, the entire world was simultaneously experiencing the same situation. One of the hallmarks of this period was the guidance for people to remain in isolation, in their homes. This revealed the need to rethink the ways we had been acting in our cultures and societies, that is, other ways of being in the world had to be invented.

This situation affected many social contexts, including educational institutions. Schools and universities, in various parts of the world, had to transfer typical pedagogical methodologies and practices from physical learning territories, in what has been called emergency remote teaching [1]. In this new scenario, school practices had to be carried out using digital technologies. Many of them have already been used since the end of the 20th century in distance education actions. DICT have been integrated into everyday life for over 30 years, however, it was with the suspension of face-to-face classes, due

to the Coronavirus, that it became evident, for many, the potential of digital technologies for carrying out communicative and pedagogical processes mediated by digital technologies.

Moreira, Henriques and Barros [1] point out this pandemic situation as an important moment of transition in school practices, since teachers had to learn to use technological tools to prepare resources, record video lessons, use videoconferencing systems and communication platforms. learning. In this sense, the emergency period has become a time to disengage the teaching action and, with that, broaden its perspective. The authors also state with concern that in most cases, these technologies were and are being used in a merely instrumental perspective, reducing methodologies and practices to merely transmissivity teaching and not in the sense of envisioning potentialities and future changes. In this article, we sought to understand, through conversations with teachers, what situations and strategies were experienced by visual arts teachers working in schools in Porto Alegre, Rio Grande do Sul, Brazil, in the period between 2020 and 2021, in particular, in concerning the use of DICT.

II. THE CONTEXT OF VISUAL ARTS EDUCATION

Throughout the history of Brazilian Art education, different moments can be listed, linked to different pedagogical proposals that, even today, can be perceived when we observe more closely the practices carried out in the school context. In the contemporary scenario of art teaching, we have the figure of Ana Mae Barbosa [2] as a proponent who pointed out a significant path for changes in what had been carried out in school art teaching until the 1980s. 1980 a proposal called Triangular Approach in which it proposes that the teaching of Art be developed from three main axes, namely: the contextualization, the artistic production and reading images. In this proposal, the author argues that these three axes are developed concomitantly, providing opportunities for the formation of critical individuals. Fernando Hernandez [3] also highlights the importance of images in processes related to art teaching. The author reiterates the social value of images and, therefore, argues that imagery knowledge should not be

restricted to images legitimized as Art, but broaden the study to all visual productions that permeate cultures, including artistic productions in the context of visual culture, media and everyday life. Miriam Celeste Martins [4] is part of the discussions about teaching Art from the conception of mediation and, with that, emphasizes the importance of the Art teacher assuming the role of cultural mediator and proposer. Thus, art teaching constitutes a moment in which strategies proposing cultural mediation are put into action, in which students will build their knowledge in art. In this perspective, Stela Barbieri [5] points out that educational practices in art must be related to the artistic productions of their time. Thus, bearing in mind that many contemporary productions have turned their focus to providing experiences to the public, it is essential that actions in the school context act in this direction. Taking into account these aspects, which characterize contemporary school teaching of visual arts, what strategies and experiences constituted and characterized it in the midst of the COVID-19 pandemic?

III. TEACHING VISUAL ARTS DURING THE COVID-19 PANDEMIC

In order to understand what happened in teaching art during the pandemic period, visual arts teachers working in different schools in the city of Porto Alegre, located in the state of Rio Grande Sul, in southern Brazil, were contacted. The idea was to create a moment of conversation in which teachers could report their actions and strategies. To this end, some questions were prepared without the intention of performing them in a single sequence. The questions were structured just as guiding themes to establish the conversation. Four moments of interviews were carried out via video call, each with a different teacher.

During 2020 and 2021, these teachers worked in Brazilian Basic Education, which ranges from kindergarten to the 3rd year of high school. It is noteworthy that each of the professors worked, in the indicated period, in institutions of different educational systems: public (municipal, state and federal) and private. All teachers have specific training in visual art education and have been working as art teachers in the school context for at least 5 years. In this writing, such professors will be identified from their teaching network. To carry out the interviews, some triggering questions were created that guided the process. Below, some clippings of these interviews will be presented without actually bringing the questions, but bringing the subjects addressed in them together with the teachers' comments and reflections generated from the answers.

IV. OVERVIEW OF INTERVIEWS WITH TEACHERS

A. Before the pandemic

The interviews with the teachers began with an attempt to understand the school reality before the pandemic, in particular about the use of digital technologies in the context of visual arts classes. In the reports of the interviewed teachers, the use of cell phones was allowed by them, despite the institutions having restrictions on the use of these devices. Such as, for example, Law No. 12,884, of January 3, 2008, which prohibits "the use of cell phone devices in classrooms, in educational

establishments in the state of Rio Grande do Sul" and guides so that these devices be kept turned off during lessons. Even though this is a specific legislation of the state education system, it reverberates in other institutions located in the state. However, professors claim that the fight against cell phone use, in current times, ends up being exhausting and without result. In view of this, they seek to create strategies for the use of cell phones in the classroom, using them to consult information, images, texts, websites, videos, among other types of media, necessary for teaching visual arts. One aspect that draws attention is the fact that teachers choose to use their students' personal cell phones, as in most public schools there is difficulty in accessing technological devices and the internet. Teachers from state, municipal and federal schools reported that there was a certain amount of bureaucracy and some lack of access to digital technologies, such as: computers, projectors and even a computer room. They also point out that, when they exist, there is a need to request digital devices in advance and also to schedule an appointment in the computer room, which was sometimes disputed between all the professors in the institution. As a result, the planning of activities that used computers and projectors became complicated, as reported by the teacher at the municipal school when she said that the school had "a computer room with several computers available. It's a very popular room, there's a lot of competition to use that room, so it's not very easy for you to do a project that you want to develop over a quarter, for example, because you never know if you're going to succeed. In addition to these aspects, the state school pointed out that there was equipment available for use during classes, however, many of them were outdated and, therefore, were considered obsolete. The teacher at the private school, on the other hand, reports a different reality, in which she points out that the classrooms were equipped with fast internet, projector and speakers, available at any time. The teacher also adds that the school even had software packages created for the educational context and the room with a green background, even before the pandemic. In this way, the scenario before 2020 presented a very significant difference in the contexts of public and private institutions regarding the use of technologies and the internet at school.

B. During the pandemic

When addressing the context of the pandemic, even before emphasizing the teaching of visual arts, the aspect related to work overload was an issue highlighted and that had not been planned in the triggering questions. About this, all teachers reported having been faced with an unexpected excess of work. And, they claimed their difficulties in reconciling professional and personal life, in a context of isolation in their homes. The teacher at the municipal school reports that it was difficult to maintain a personal life, even more so because we were at home and, during the pandemic, we had a serious health problem that crossed our professional and personal daily life, being in our home environment.

Teachers reported that the overload arose precisely due to the pandemic and the transition to remote teaching, and there are several factors that helped in the excess of working hours, such as unpreparedness to teach online, correction of activities more frequently due to the institution's method of accounting online presence, difficulties with the use of digital technologies

and also the lack of boundaries between home and work, the use of leisure time to correct tasks, plan classes, among other issues related to professional life. The Professor of the state school observed that “the remote was not working, it was not working, in short, many complaints from students, in addition to us, who were also not succeeding, especially colleagues who have greater difficulty with the technological issue”. In the context of the private school, the teacher claims that “this transition brought an overload. Yes, because, for example, when everyone went online, the way they found for us to be present was for all students, individually, to hand in a task in Moodle. Can you imagine each class for me to count attendance? I'm going to have to grade an assigned assignment, and then you have 700 students. Then every week you will evaluate 700 activities to see if he was present”. With that, the students became a huge list of evaluations for the professors who could no longer even remember the names of the students or who they were working with. This situation greatly affected the relationships between professors and students, causing a feeling of apathy, faces became icons on a screen that often did not have the student's photo, which made it difficult to assimilate the student's name and face. The private school teacher said that she accessed the classroom environment in the morning and, when saying good morning, she did not receive a response, “you are there, the students too, without opening the cameras. And so we ended up teaching icons, some put images, others didn't put profile pictures, these being of an unknown character, so I end up not assimilating the name and face”. At the state school, the teacher said that “I didn't know who I was working with. I have no idea who he is and what he does. If a student of mine from the past passed by me, I don't even know who that person is. Because it was very rare for a person to open the camera in the video lessons. People were a symbol, a letter, an image, a name there, in addition to being a name on a list”.

In another context, the teacher of the municipal school, who worked with the first years of Basic Education, mentioned a closer approach to children through the virtual means of communication. The little ones appear to have better communicability and a reduction in the shyness of shyer students behind the screens. In addition to the students, the families also had a closer relationship with the teacher during this period. She points out that “in a way we became very close. Because in a class of twenty, thirty students, sometimes you can't pay attention to a shy child. So, as our communication was, it wasn't just during the periods we had in the classroom, before the pandemic it was a whole day in those WhatsApp groups. Some children were very shy and managed to be heard. That through technology they were able to express themselves better. I became very close, closer to my students than I was before. And families too because of this twenty-four-hour interaction. And why everyone was also living a difficult time. If you support, listen to the other, give a word of comfort, affection”.

The relationship between teachers and family has also changed in some contexts, as reported by the state school teacher when claiming that his Elementary School students received excessive help from family members. The teacher further claims that “it is very difficult to bring the High School family closer to the school by itself, and in the pandemic it was

much worse. [...] I had no family contact during the pandemic. Already in the initial fundamental, I am in all the groups of the classes, with family members. So, family contact was frequent. Families help children as much as possible and sometimes even do activities. We see that the child barely knows how to use scissors, but look how well the paper is cut here. It was funny, during the pandemic, the child did the activity, cut, pasted, did all that, then in person the child does not know how to use scissors”.

It is important to emphasize that this family absence in the school life of high school students are not conditions strictly related to the pandemic, because even before, the relationships between guardians and school were already limited. Based on this, the hypothesis arises that the factor through which children in the early years achieved better performance in school activities, according to the report of the municipal school teacher, is that the role of mediator and guide of the development process that takes place located on the teacher in face-to-face teaching, ended up being assigned to those responsible during remote teaching. In high school, for example, with the absence of families and the supposed autonomy of adolescents, this role is either assumed by the student himself or it can be lost and culminate in learning difficulties. Not all families were able to help in the learning process, as the lack of financial conditions, lack of time to help with schoolwork and, sometimes, the family's lack of education also hindered the learning and literacy of children, who were not enjoying school space and time.

A general perception on the part of teachers was the drastic decrease in student participation during remote teaching. There were few students who managed to continue performing activities and follow classes as before the pandemic. The federal school teacher notes that out of a class of eleven students, only three were frequent during the pandemic. In this scenario, teachers realized that, in addition to all the work that had already changed, they had to seek engagement strategies for those students who were dropping out. The didactics and materials that were used before the pandemic no longer achieved the same success in a virtual way. The teacher of the state school notes that in the beginning he elaborated “material closer to what I would teach in class, with videos, with interviews to read, to analyse something, to write an authorial text or to produce something”, but very few students performed and returned to activities.

Due to this lack of student participation, assessment methods also needed to be rethought. Arslan and Iavelberg [6] remind us that the assessment is related to the processes of construction of knowledge and learning and, therefore, must be related to previously defined objectives, highlighting the importance of considering the modes of learning and the personal characteristics of each student, the learning conditions. If before the evaluation was carried out during the classes, with the monitoring of the students' development, in remote teaching this was not possible. It was necessary to take into account the contexts and learning conditions [7] in which the students were inserted at that time. With this, the evaluation started to be based on activities carried out within the possibilities of each student and the deadlines were extended. For Moran [8] merging and flexibility are key concepts to deal with current

challenges, so papers with delays of months, quarters were accepted, so that somehow they could assess the student's performance. Which, in a way, meant that the educator had to work twice as hard, as it was necessary to reopen activities, monitor the development of previous propositions and evaluate past tasks once more.

In the context of the pandemic, the professors claimed that many propositions ended up gaining objectives aimed at maintaining the bond, leaving aside the pedagogical proposals that should be developed by the students. The teacher of the private school pointed out that "many evaluation issues had to be overlooked, which did not happen before", such as receiving work that was very late. In the same way, the teacher from the municipal school claimed that the social context of the students interfered in the process of carrying out the activities, and also in the evaluation, because "how to evaluate a student that I know about the financial conditions, that the family is going through situations of being without quality internet access and that many activities would not be equivalent to a face-to-face class. Thus, she said she did not feel able to assess any student.

Evidently the lack of good quality equipment and internet was observed in several contexts. In the federal school, upon realizing these circumstances, teachers mobilized to help families of students with financial difficulties, creating a project that distributed donations from computers to basic food baskets. The federal school teacher claimed that a project was created that collected various equipment from those students who were unable to acquire them. However, providing equipment was not enough, as quality internet access had to be guaranteed so that students could access the platforms used by educational networks. The lack of equipment, added to the lack of internet and, sometimes, the lack of knowledge to use the platforms, led to some evasions, especially in public networks. In this way, aspects such as social inequality were even more evident with the pandemic.

When addressing issues specifically related to the teaching of visual arts, the teacher from the municipal school claimed that she did not understand how the teaching of Art could occur remotely, "But little by little I saw that it is possible. It's not ideal, for example I have a student who wants to study architecture and she draws houses. And so, how are you going to explain it?". However, she claimed that the use of videos available on the internet could be of great value in these cases.

In addition, there was the difficulty with resources, which was another aspect that affected the visual arts classes, especially the practical ones. The lack of face-to-face classes made it difficult to provide guidance on the processes for carrying out the proposals and, furthermore, the lack of materials that were usually provided by the school. In addition, it was not possible to request such materials from students, for economic reasons or to avoid compromising the social isolation of families in the purchase of materials and due to the frequent lockdown of stores. "I had to think about the issue of materials, because most didn't have material at home and even the school giving out some kits is quite complex, some of them wouldn't be picked up. To think that, in my little ones, that would pass through the family, and the family would need to understand. So it was like this, a reorganization of the way of thinking about

the class. Thinking about the issue of the theme, the provocation and thinking that this was within a family nucleus that was going to be part of that because I don't do teenage work, autonomous", claims the teacher of the municipal school.

Care was also noted in the choice of theme and in the reflective propositions of the classes. When addressing the topic of the pandemic and, if it had been addressed in the art classes, the teachers from the municipal and the private school reported a concern about how to delve into subjects that could worsen the psychological state of the students, since the pandemic was a major aggravator of mental disorders. The teacher of the private school used to use the theme to start works in which she proposed an indirect relationship with the pandemic, turning the discussion to overcoming life's challenges and, as an example of this, there was the pandemic.

The teacher from the municipal school claimed to be careful when selecting content in order not to highlight social differences and create other situations of discomfort, since she could not discuss these issues directly with the students. In view of this, he sought artistic productions that addressed the current reality, such as the exposure of an Instagram profile that displayed different types of masks, artistically created, to make a connection with the necessary use of masks motivated by the virus. The teacher proposed a relationship between the social network profile called "Mascorona" and talked to the students about what the mask was in the history of art and about the need for its use today. From that, she proposed that they invent masks and make a record of them commenting on their production.

The federal school teacher was in the planning phase at the time of the conversation and was thinking of a way to exhibit the students' work on the same theme. She said that she would like to exhibit many of her students' works, created during the pandemic, but that not all allow viewing, as they are very intimate topics. This teacher's report points to evidence of practices related to art teaching, in particular the use of images, whether for reading or producing them. In this way, it is clear that, even with all the obstacles and crossings caused by the pandemic, there was a moment of artistic production and experimentation. If, in a way, the various reports pointed to a chaotic scenario, in which the difficulties of teachers and students stand out, it is noted that it was possible to provide a moment of creation. And what seemed like chaos became a moment of reflection and creation, giving students the opportunity to reflect on what was happening and on the means they could use to share their experiences. In a way, this report turns on a light that signals possibilities and potential that the chaos of the pandemic has brought.

C. After the second half of 2021

In the second half of 2021, many schools returned with in-person classes again, although the COVID-19 pandemic was not over. This happened because with the vaccination of the population in progress, the cases of hospitalization were decreasing. Despite the fear of contamination, and the fact that children in the early years of elementary school and kindergarten have not yet been vaccinated, educators were apprehensive about continuing online. Due to an issue that started during remote teaching and continues in face-to-face teaching, according to the reports, the implications for the

mental health of students and even teachers themselves meant that the return of face-to-face teaching was taken into account.

Many of the sequelae present in students could be perceived by teachers during online classes. And even with the return of face-to-face classes, these signs are still present. The private school teacher noted that the socialization of students had changed and the perception was that everything was new for everyone. Teachers and students did not seem to know each other and, in addition, many of them entered the room with their heads down, tired and with a medical indication of depression. Perceptions of the development or worsening of eating disorders and mental disorders such as depression and anxiety in students are mentioned by all professors in the interviews. And, in general, they claimed that remote classes were described as ineffective and dysfunctional, especially in the year 2020, in which the transition from face-to-face to remote learning took place and little was known about how to deal with the situation. With all these adversities described above, teaching Visual arts during the pandemic has become a major challenge for teachers, thus bringing reflections about the school, art teaching and the faculty itself.

The teacher of the municipal school warned that "a point to be highlighted is for families to see what we do and see the importance and that Art is not just drawing", since this discipline does not always have the respect and recognition on the part of the community school. The teacher claimed to always make it clear that art is a way of thinking about and with the world, it was not simply a doing and that I don't care about the child knowing how to draw, but the construction of thought. In this sense, the teacher claims to have done what she considers effective, as the families followed what was being done. With that, they realized that home schooling is not just playing content for a child. It is understood in the quote above that a possible recognition and understanding of the teacher's work and the teaching of Visual arts by the students' families emerged, in the face of the pandemic situation.

The experiences of the educators interviewed bring reflections on teaching and their needs, the importance of reflection and planning and, above all, having time to learn from their own experiences, as can be seen in the report of the teacher of the municipal school when she says that "it is important for the teacher to have time for planning, and how much this makes his classes more powerful. Therefore, it is necessary for the teacher to have less face-to-face workload and to have a little more time for planning". It also comments on the disappointment of trying to reproduce the idea of the saviour teacher, and the myth of the hero teacher, the one who needs to handle, and does, numerous functions that do not fit him to supposedly transform the world into a better place. Silva and Correa [9] problematize this conception, there are many discussions about the role of the teacher today. He needs to be a father, mother, psychologist, social worker and everything else that society requires. This contributes to the school being seen as the only source of knowledge, which is not true, and to act from this perspective in the training of subjects. It is appropriate here to criticize the famous "system" that plays everything from the top down, pushing educational methods without providing the means for their execution.

There are possible transformations based on the educator's role, but it is necessary to recognize limitations and issues that are beyond their own power of choice. The private school teacher claimed that "a great learning experience was knowing how to understand yourself, knowing your own limits, and that we cannot do everything. Sometimes, we teachers think that we can completely change the world and transform it. But you are a human being too. You are not going to change the world completely. If you manage to plant a seed in the hearts of some students, but it's punctual, it's simpler than it looks. So I think it was this reality shock that I had in this process.

FINAL CONSIDERATIONS

The period between 2020 and 2021 was marked by the request that people stay at home, due to the COVID-19 pandemic, as a result, institutions of various categories had to change their ways of acting, in this context are school institutions. This situation highlighted the possibility of using DICT, which had already been used in the educational context for over 30 years. But, how did the pandemic and the use of technologies in school processes occur in the context of Visual arts teaching? This was the concern that mobilized this writing, which had the participation of teachers' voices brought from conversations with them in order to understand their strategies and experiences during the aforementioned period.

The first finding was that, even if the schools had some technological equipment, most of it was not used much due to restrictions due to the small number of equipment or its outdated status. Furthermore, cell phone use was a possibility, even with the ban on its use during classes. Thus, professors created strategies to integrate digital technologies in a way that would be favourable to the teaching of Visual arts.

Aspects such as work overload during the pandemic, changes in practices, flexibility in assessments and reflection on the curriculum and didactics were highlighted during the teaching reports. They mentioned having rethought their plans, activities, assessments, practices, materials, digital platforms and themes, several times during remote and hybrid teaching. They also showed extreme concern for students' learning and well-being, looking for new adaptations and modifications that would bring engagement to the classes.

In addition, it was found that the students' financial conditions were a factor that had an impact on learning, since it was necessary to use digital technologies such as a good computer, a cell phone with good memory, fast internet and broadband, microphone and webcam. In addition, many suffered from a lack of food, unemployed families and in financial crisis caused by the pandemic. Even with few possibilities to help students in this case, many teachers mobilized to get technological devices, basic food baskets and to show themselves available to help the neediest families. In this way, the abyss between poverty and wealth was shown to be much greater. Those who no longer had conditions, suffered a much greater impact from the pandemic. Facing so many difficulties to have the minimum for their survival, achieving success and social ascension through studies is increasingly distant from reality for poorer students.

Some teachers at the beginning of remote classes believed that it was impossible to hold a Visual arts online classes, due to the lack of presence, being together and present in the same space and time, especially in practical classes that need the touch, the look and from the real perspective at work. It was necessary to adapt to the conditions possible at the time, it can be said that, in short, remote classes was a constant adaptation and improvement of strategies for the Visual arts teachers interviewed. The curation of themes proposed in the classes had to be extremely careful, since many students were facing psychological disorders and showed many emotional weaknesses. After noticing the lack of engagement and the students' difficulty in persisting with their studies, the teachers tried to modify and improve their teaching strategies, their materials and made several aspects more flexible to try to support at least some students who were disoriented. In general, remote teaching was a major challenge for respondents, who saw numerous negative points brought about by this scenario and described it as an extremely arduous process. As a positive point, the teachers felt able to face challenges in teaching and in the case in which the teacher felt that the discipline of Arts had greater visibility. She also noted that it was possible to try to deconstruct the vision focused on the final result that one has in Arts classes. In this scenario, brought by the teachers, it was noticed that there was no single strategy or methodology that permeated remote teaching, but a set of actions and adaptations that are in motion, at all times, looking for development according to the difficulties encountered during the process.

In general, the pandemic situation pointed to the lack of resources and other difficulties mentioned during this study, which did not allow enough time and peace of mind for teachers to stop and think about more elaborate strategies. Teachers were so concerned about resolving essential conditions for the classes to take place at a minimum that, sometimes, thinking about large productions was left in the background. There were many limitations that could not always be solved, but being aware that not everything is under your control is part of the

process of being a teacher. Our society, in general, has created an image of a hero teacher, that is, one who has the power to save the world from all evils. As a result, many teachers end up frustrated and disappointed, as there are no teaching superpowers. It is not part of the educator's role to save the whole world, it is necessary to recognize their own limitations and the environment in which they are inserted, to know that yes, people can be transformed with education, but it happens in a more punctual and light way. It is not necessary to exhaust yourself and constantly push yourself to generate big changes, such expectations end up generating great frustration when you are faced with difficulties that are not within your reach.
